

OPPORTUNITIES ON WEBGIS

Jörg Hartleib

University Greifswald, Germany, Institut of Geography and Geology, Chair of Cartography and GIS

ABSTRACT

WebGIS is one of the most rapid developing sections of Geoinformatics. Standardization and open program codes make it feasible for a wide range of interested communities to use it and to take advantage of it. WebGIS can be implemented not only as a standalone tool for the public, but also can be an essential part of scientific web applications.

Selected applications will be presented from the fields of science, public relation, and education established in Germany and Vietnam. In addition to the outlook on developing requirements in future, special attention will be directed to the strengths of distributed systems and data standardization.
